Owners and operators of regulated underground storage tanks (USTs) on tribal lands must comply with federal UST regulations.

This compliance assistance brochure highlights best management practices for spill buckets.

Note: This document is a resource to promote compliance and does not replace the federal UST regulations.

EPA developed this brochure to help UST owners and operators in Indian country comply with the federal UST regulations.

This brochure is one in a series of EPA compliance assistance brochures designed to help owners and operators comply with UST regulations.

Other brochures focus on overfill protection, recordkeeping and notification, financial responsibility, insurance, tank release detection, and piping release detection.

Compliance Assistance In Indian Country
**SPILL PREVENTION**

*Spill prevention* is required for every underground storage tank (UST) that is filled with more than 25 gallons of product at one time. Spill prevention devices attached to your UST (for example a spill bucket) can help prevent releases into the environment.

**What can you do to prevent spills from spill buckets?**

**Remove debris/liquid in spill buckets**
- Spill buckets are designed to temporarily contain small product spills released during delivery and are not for long-term storage of product. Accumulated debris or liquid reduces containment capacity and ability to prevent spills.

**Replace damaged gaskets and seals**
- Damaged seals and gaskets can result in non-tight spill buckets. This can allow a release into the environment.

![Damaged seal in poor condition](image)

- Periodically inspect all seals—including around the fill riser—for any cracks, damage, or holes. Replace or repair, as needed.

**Repair or replace damaged spill buckets**
- Damaged, cracked, or corroded spill buckets are not liquid-tight and will not contain the spilled product.

![Deformed spill bucket wall](image)

- Periodically inspect for damage, corrosion, and deformation.
- Most spill containment is not designed to last as long as an UST.
- Perform an integrity test and, if necessary, repair or replace to make sure it works properly.

**REMEMBER**

- A damaged, missing, or poorly fitting spill bucket lid may allow water and debris to collect in the spill bucket and enter into the tank.
- Inspect spill buckets before and immediately after product delivery. Remove spilled product immediately.
- Keep spill buckets clean and free of liquids and debris.
  - Inspect spill buckets after it rains, or after snow melts.
  - Dispose of liquid properly.
- Repair or replace damaged spill buckets and lids immediately.
- Inspect and replace damaged seals and gaskets immediately.
- Inspect and replace damaged spill bucket drain valves immediately.

*If you are not sure about the tightness of your spill buckets, have a qualified service technician test them for leaks.*

**Keep your spill buckets clean and dry.** Empty spill buckets immediately and properly dispose of the contents.
